Alternative practical models for genetic services in the era of increased demand

Brief Synopsis:

Genetic testing indications for hereditary cancer is expanding, especially since testing now can be used for therapeutic strategies (PARP inhibitors in BRCA germline mutation carriers). This comes with challenges such as how to best provide genetic counseling and testing services. Several models have been explored such as using telemedicine (phone or web-based) or using artificial intelligence. This session will discuss current status and future directions in cancer genetics service delivery.
